

1 Certify fine-token laws

One simultaneous event over source-label strata

$S = 0$	0.80	0.15	0.05
$S = 1$	0.65	0.30	0.05
	c_1	c_2	c_3

$$\Pr(\mathcal{E}) \geq 1 - \delta$$

2 Optimize on the same table

The event covers every stochastic release channel

$$M \in \text{Stoch}(K, L)$$

continuum-wide, no channel-count penalty

jointly select M and decoder g

3 Shift occurs before release

Common drift plus bounded source-specific contamination

$$q_s = t_y p_s T_y + (1 - t_y) r_s$$

same T_y , t_y across sources; $t_y \geq 1 - \eta_y$

nothing bypasses the software channel

4 Release only with a certificate

Exact Bayes attacker, worst-stratum utility, or abstain

DEPLOY

otherwise: ABSTAIN
